

Adviser Evaluation and Suggested Correction

Chapter 1 - Introduction

1. Introduction

My Evaluation/Comment

I find the topic relevant and socially significant because the proposed system addresses sensitive services involving women, children, and families. The chapter explains the limitations of manual and fragmented records. However, it makes unverified claims concerning legal compliance, vulnerability assessment, child-nutrition assessment, artificial intelligence, security, and improved decision-making.

My Required Correction/Suggestion

I require you to qualify every claim that has not yet been objectively demonstrated. Replace absolute phrases such as "ensures compliance," "accurately classifies," "guarantees security," and "improves decision-making" with cautious wording such as "is designed to support," "provides a preliminary indicator," or "incorporates selected controls." Cite the specific law, guideline, standard, or validation result supporting every legal, health, AI, and security claim.

Possible Revised Statement or Output

Possible revised statement:

"The proposed system is designed to support the authorized documentation, monitoring, and reporting activities of Barangay 183. Its risk, nutrition, chatbot, privacy, and security functions remain subject to professional validation and objective testing before operational adoption."

2. Project Context

My Evaluation/Comment

I find that the project context describes the operational concerns of Barangay 183, but most of the problems are stated generally. The manuscript does not present sufficient local evidence for delayed responses, difficult record retrieval, poor monitoring, increasing case volume, or privacy risks.

My Required Correction/Suggestion

I require you to present the complete pre-assessment findings. Identify the respondents, dates, interview questions, observation period, records reviewed, current workflow, retrieval time, report-preparation time, error frequency, monitoring problems, confidentiality concerns, and resulting system requirements. Distinguish findings actually observed in Barangay 183 from general problems reported in the literature.

Existing Process	Evidence/Respondents	Baseline Measurement	Identified Problem	Resulting Requirement
Case retrieval	___ records/trials	___ minutes	Slow manual search	Centralized search function

Report preparation	___ reports	___ minutes/hours	Manual consolidation	Automated reporting
Case monitoring	___ cases	___ incomplete updates	Status not visible	Status-tracking module
Confidentiality	Interview/observation	___ incidents/risks	Possible unauthorized access	RBAC and audit logging

Possible Revised Statement or Output

Possible revised statement:

"Based on interviews with ___ authorized personnel and observation of ___ records from ___ to ___, the existing process required an average of ___ minutes to retrieve a case record and ___ minutes to prepare a report. These findings established the need for centralized retrieval, controlled access, and automated reporting."

3. Project Purpose and Description

My Evaluation/Comment

I find the project scope too broad for its present level of validation. It combines VAWC case management, BCPC child-nutrition assessment, GAD monitoring, organization membership, relief-distribution monitoring, analytics, vulnerability scoring, an AI legal-information chatbot, and administrative appeals. These functions involve different laws, professional competencies, users, risks, and validation requirements.

My Required Correction/Suggestion

I require you to identify which modules were formally requested and authorized by Barangay 183. Provide a stakeholder-requirement matrix showing the requesting office, authorized user, supporting policy, validator, and acceptance evidence for each module. Remove or classify as experimental any module that was not formally requested or cannot be validated by the appropriate VAWC officer, social worker, legal expert, Barangay Nutrition Scholar, health professional, Data Protection Officer, or authorized barangay official.

Possible Revised Statement or Output

Possible revised output:

Add a Stakeholder Authorization Matrix with the columns Module, Requesting Office, Authorized Users, Policy or Legal Basis, Validator, and Validation Status.

4. Vulnerability Risk Assessment

My Evaluation/Comment

I find the "VAWC-RAVE" mechanism insufficiently established. The manuscript does not prove that its 4-to-12 score, equal weighting, four factors, and Low-to-Critical thresholds come from an officially recognized and validated VAWC instrument. An arbitrary score may dangerously underclassify or overclassify a case.

My Required Correction/Suggestion

I require you to identify the original authoritative source of "VAWC-RAVE." If it is your own model, explicitly

call it a researcher-developed advisory risk indicator, not an official assessment instrument. Define every factor and score, justify the weights and cutoffs, and secure validation from qualified VAWC professionals, social workers, and legal experts.

Validate it using de-identified or authorized case scenarios independently classified by qualified experts. Report the expert reference classification, system classification, confusion matrix, sensitivity/recall for High and Critical cases, specificity, precision, F1-score, weighted agreement measure, false-negative analysis, and pass-or-fail criterion.

Until validation is completed, display: "Advisory Risk Indicator - Subject to Authorized Professional Assessment." The score must not automatically determine intervention, referral, BPO issuance, or case disposition.

Possible Revised Statement or Output

Possible revised statement:

"The researcher-developed risk indicator assigns a preliminary advisory category based on validated criteria. It does not replace professional assessment, legal judgment, or emergency-response protocols. All High and Critical outputs require immediate review by authorized VAWC personnel."

5. Legal Workflow and BPO Authority

My Evaluation/Comment

The manuscript incorrectly suggests that Head Committee members or VAW Desk Officers may issue a Barangay Protection Order. The system must not assign legal authority to unauthorized users.

My Required Correction/Suggestion

Revise the role and permission matrix. The system may facilitate, prepare, document, or monitor the BPO workflow, but the recorded issuing authority must be the legally authorized official. Have the full workflow reviewed and signed by a qualified legal expert and authorized VAWC personnel.

Suggested corrected paragraph:

"The system assists authorized barangay personnel in documenting BPO applications, monitoring statutory timelines, recording actions taken by the proper issuing authority, and preparing referral or transmittal documents. It does not independently issue a BPO or replace the judgment and legal authority of the authorized official."

Possible Revised Statement or Output

Possible revised statement:

"The system records and monitors the BPO workflow but does not issue a BPO. Issuance remains an action of the legally authorized barangay official, whose name, position, decision, date, and supporting document are recorded in the system."

6. AI Legal-Information Chatbot

My Evaluation/Comment

I find the chatbot outside the adequately evaluated core of the study. The manuscript identifies NLTK and an MLPClassifier but does not report the training dataset, intents, preprocessing, split, predictive results, unsafe-query testing, fallback behavior, privacy controls, or legal validation.

My Required Correction/Suggestion

I require you either to remove the chatbot or include it explicitly in the title/scope, objectives, methodology, and results. If retained, report the training-data source, number of intents and utterances, training-validation-test split, confusion matrix, accuracy, precision, recall, F1-score, unsupported-query rate, dangerous-response testing, escalation procedure, and legal expert validation.

Restrict the chatbot to verified general information. It must not provide personalized legal advice, classify a case, predict legal outcomes, recommend legal charges, or make official barangay decisions. Add a visible disclaimer and an emergency/referral pathway.

Possible Revised Statement or Output

Possible revised statement:

"The chatbot provides only verified general information and official referral details. It does not give personalized legal advice, classify cases, determine liability, or replace a lawyer, VAWC officer, social worker, or authorized barangay official."

7. Child-Nutrition Assessment

My Evaluation/Comment

I find the claim of producing "exact fractional z-scores" through simple linear interpolation technically questionable. The manuscript does not demonstrate equivalence with the official WHO or authorized e-OPT Plus computation. Automatic enrollment based solely on the system result is also inappropriate.

My Required Correction/Suggestion

Validate the system output against the official reference tool using the same test records. Present the official value and classification, system value and classification, numerical difference, match result, and pass-or-fail decision. Secure validation from a Barangay Nutrition Scholar, registered nutritionist-dietitian, or qualified health professional.

Replace automatic enrollment with an advisory referral: "For verification by authorized nutrition or health personnel." State that the result is not a medical diagnosis or automatic basis for program enrollment.

Possible Revised Statement or Output

Possible revised statement:

"The system generates a preliminary nutritional-status result for verification by authorized nutrition or health personnel. It does not provide a medical diagnosis or automatically enroll a child in a feeding program."

8. Conceptual Framework

My Evaluation/Comment

I find the IPO framework understandable but overloaded. It does not clearly distinguish system processing from professional judgment, authorization, and research evaluation.

My Required Correction/Suggestion

Redesign the framework to show five distinct components: Inputs, System Processes, Decision-Support Outputs, Human Review/Authorization, and Evaluation/Feedback. Show that vulnerability classifications, nutritional results, and legal information require authorized human review before any action is taken.

Possible Revised Statement or Output

Possible revised output:

Revise the framework to: Inputs → System Processing → Advisory Outputs → Authorized Human Review and Decision → Evaluation and Feedback.

9. Research Questions and Objectives

My Evaluation/Comment

I find the questions and objectives generally parallel, but Objectives 1 and 4 require comparative evidence that Chapter 4 does not provide. The current objectives also omit validation of the most sensitive system features.

My Required Correction/Suggestion

Revise the research questions and objectives to require: (1) documented pre-assessment; (2) objective manual-versus-system testing; (3) expert validation of the risk model; (4) verification of nutrition computations; (5) validation of the statutory workflow; (6) objective privacy, security, backup, and recovery tests; and (7) chatbot validation if retained.

Suggested general objective:

To design, develop, and evaluate a secure web-based system that supports the authorized management, monitoring, reporting, and decision-support requirements of women and family protection services in Barangay 183, Villamor Airbase, Pasay City.

Possible Revised Statement or Output

Possible revised objective:

"To validate the researcher-developed vulnerability risk indicator by comparing its classifications with the independent classifications of qualified VAWC professionals using an authorized set of de-identified case scenarios."

10. Scope and Limitations

My Evaluation/Comment

I find the scope comprehensive but overly assertive. The manuscript uses "strict compliance," "full

compliance," "enterprise-grade security," "immutable audit logging," and "exact z-scores" without sufficient independent proof.

My Required Correction/Suggestion

Remove absolute claims unless supported by formal audits or validation. Add limitations involving false risk classification, incorrect nutrition results, chatbot misinformation, identity-matching errors, unauthorized access, data breaches, secondary use of sensitive information, limited respondents, and absence of long-term operational testing.

Chapter 1 Rating: 66%

Possible Revised Statement or Output

Possible revised limitation:

"The risk indicator, chatbot responses, and nutrition results are advisory and depend on the accuracy and completeness of encoded data. These outputs require authorized human verification and must not independently trigger legal, medical, or protective action."

Chapter 2 - Review of Related Literature

1. Organization and Relevance

My Evaluation/Comment

I find that the RRL is organized into relevant themes, but it remains predominantly descriptive. It frequently defines a concept, states general benefits, identifies a broad limitation, and relates it to the proposed system without critically comparing actual studies.

My Required Correction/Suggestion

For every theme, compare the authors, setting, research method, respondents or dataset, technology, findings, limitations, and specific contribution to the present study. End each theme with a short synthesis explaining what is already known, what remains unresolved, and how your study will address the gap without overstating novelty.

Possible Revised Statement or Output

Possible revised synthesis sentence:

"Although the reviewed systems improved record accessibility, most evaluated general administrative transactions rather than legally sensitive VAWC workflows. This limits their direct applicability and establishes the need for domain-specific legal, privacy, and professional validation."

2. Vulnerability Risk-Assessment Literature

My Evaluation/Comment

I find no sufficient scholarly or official basis for the VAWC-RAVE name, factors, equal weighting, 1-to-12 score, and proposed thresholds.

My Required Correction/Suggestion

Locate and analyze an officially recognized or professionally validated risk-assessment framework. If none is adopted, disclose that your criteria are researcher-developed and document the expert-development and validation process. Do not present the model as an established standard.

Possible Revised Statement or Output

Possible revised statement:

"No retrieved source was treated as proof that the proposed weights and thresholds are officially established. Accordingly, the study treats the scoring mechanism as researcher-developed and subjects it to expert content validation and classification testing."

3. Child-Growth Computation Literature

My Evaluation/Comment

The chapter treats simple interpolation as the basis for exact anthropometric z-scores without adequately discussing the official WHO methodology.

My Required Correction/Suggestion

Replace the simplified explanation with a discussion of the official sex-specific WHO standards, required variables, authorized computation method, and e-OPT Plus procedure. Cite the primary WHO and NNC materials. Explain how your implementation will be verified against the official tool.

Possible Revised Statement or Output

Possible revised statement:

"The implementation uses the authorized reference data and computation procedure and is verified using identical records processed through the official reference tool. Classification agreement and numerical differences are reported in Chapter 4."

4. Legal and Regulatory Literature

My Evaluation/Comment

The legal discussion uses broad statements and secondary materials where primary legal authorities are required. RA 11037 supports a feeding period of at least 120 days but does not, by itself, establish the exact weighing milestones claimed in the manuscript.

My Required Correction/Suggestion

Use the complete law, implementing rules, Supreme Court rules, and relevant issuances from DILG, DSWD, NNC, DOH, and the National Privacy Commission. Identify the exact official guideline supporting each claimed workflow, deadline, authority, and monitoring milestone. Remove any procedural claim without an authoritative source.

Possible Revised Statement or Output

Possible revised output:

Add a Legal Requirements Matrix with Law or Issuance, Exact Section, Required Procedure, Authorized Actor,

5. ISO/IEC 25010

My Evaluation/Comment

The citation "ISO/IEC 25010:2022" is incorrect. The eight-characteristic model corresponds to the 2011 edition, while the 2023 model contains nine characteristics.

My Required Correction/Suggestion

Since the approved institutional capstone instrument uses eight characteristics, identify the model accurately as ISO/IEC 25010:2011 and explain that it is the approved framework used in the study. Ensure that the definitions and survey items match that edition. Do not cite a nonexistent 2022 edition.

Possible Revised Statement or Output

Possible revised statement:

"This study uses the eight product-quality characteristics of ISO/IEC 25010:2011 because they form the approved institutional evaluation instrument. The results represent expert ratings and are not presented as ISO certification."

6. References

My Evaluation/Comment

I find the reference list to be a major weakness. Several entries have generic titles, questionable or incomplete publication details, missing volumes, issues, pages, DOI, or stable URLs, and vague institutional attribution.

My Required Correction/Suggestion

Verify every reference using the original source. Remove any citation that cannot be retrieved and authenticated. Use complete IEEE entries with authors, exact title, journal or publisher, volume, issue, pages, year, DOI, and stable URL when applicable. Give priority to primary laws, official government issuances, WHO/NNC materials, ISO information, peer-reviewed journals, and recognized conference proceedings.

Chapter 2 Rating: 48%

Possible Revised Statement or Output

Possible corrected IEEE pattern:

[1] Author Initials and Surname, "Exact article title," Journal Title, vol. x, no. x, pp. xx-xx, year, doi: xx.xxxx/xxxxx.

Chapter 3 - System Analysis and Design

1. R&D Methodology and Waterfall SDLC

My Evaluation/Comment

I find the R&D approach and Waterfall model generally appropriate, but the chapter mainly describes the phases without consistently presenting the actual outputs and approvals produced in each phase.

My Required Correction/Suggestion

For each Waterfall phase, present the actual activity, participants, dates, output, validation or approval, revision made, and final deliverable. Attach signed requirements, approved workflows, prototype-validation results, test records, deployment authorization, and maintenance responsibilities where available.

Possible Revised Statement or Output

Possible revised output:

Add a phase table with Phase, Dates, Participants, Activities, Actual Output, Validator or Approver, Revisions, and Final Status.

2. Existing-System Analysis

My Evaluation/Comment

The existing-system analysis is too general and lacks measurable baseline evidence.

My Required Correction/Suggestion

Present the complete current workflow, actors, forms, records, decision points, retrieval and reporting time, error counts, monitoring limitations, privacy risks, and authorization practices. Connect each verified gap to a specific functional or non-functional requirement.

Possible Revised Statement or Output

Possible revised statement:

"The requirements were derived from documented interviews, observation, and record review. Each verified process limitation was translated into a traceable functional or non-functional system requirement."

3. Feasibility and Cost-Benefit Analysis

My Evaluation/Comment

The financial estimates, hardware costs, labor rates, office-supply quantities, projected savings, and benefits are insufficiently supported.

My Required Correction/Suggestion

Provide barangay records, official quotations, market-price references, salary/labor bases, useful-life assumptions, and computation sheets. Verify unusual quantities and prices such as 20 boxes of bond paper, 10 boxes of pens, and ₱32,400 for photocopy ink. Label unsupported benefits as projected estimates rather than realized savings.

Possible Revised Statement or Output

Possible revised statement:

*"The projected savings are estimates based on documented annual consumption and quotations dated ____.
They should not be interpreted as realized financial benefits until confirmed through actual implementation records."*

4. System Requirements and Authorization

My Evaluation/Comment

Several requirements enter regulated legal, health, and public-sector decision-making and cannot be treated as ordinary automation functions.

My Required Correction/Suggestion

Prepare a requirements authorization matrix for BPO documentation, vulnerability classification, nutrition classification, legal chatbot responses, appeals, repeat-incident identification, audit logging, and disaster recovery. Identify the authorized owner, legal or technical basis, validator, limitations, and acceptance criteria for every sensitive function.

Possible Revised Statement or Output

Possible revised output:

Add a matrix with Requirement ID, Sensitive Function, Authorized Owner, Legal or Technical Basis, Validator, Acceptance Criterion, and Status.

5. "Repeat Offender" Classification

My Evaluation/Comment

The term "repeat offender" may improperly convert repeated allegations into a legal finding.

My Required Correction/Suggestion

Replace it with "Multiple Reported Incidents Associated with the Same Respondent." State that matching is subject to identity verification and authorized review and does not constitute guilt, conviction, or an official legal classification.

Possible Revised Statement or Output

Possible revised statement:

"The system flags multiple reported incidents that may involve the same respondent, subject to identity verification and authorized review. The flag is not a finding of guilt or a legal designation as a repeat offender."

6. Vulnerability Risk Engine

My Evaluation/Comment

The chapter contains no adequate technical test design for the risk engine.

My Required Correction/Suggestion

Add a dedicated validation plan containing the number and source of de-identified scenarios, qualifications of expert assessors, reference classification procedure, system output, confusion matrix, class-specific metrics, agreement measure, false-negative review, acceptance threshold, and safety action when experts and the system disagree.

Possible Revised Statement or Output

Possible revised output:

Add a validation table with Case ID, Expert Reference Category, System Category, Match, Error Type, Required Human Action, and Pass or Fail.

7. AI Chatbot Architecture

My Evaluation/Comment

The chatbot architecture does not adequately explain how the Python NLP component integrates with Laravel, authenticates requests, stores queries, and protects sensitive information.

My Required Correction/Suggestion

Add an architecture and data-flow diagram showing the Laravel application, chatbot service, knowledge source, authentication, logging, data retention, sanitization, fallback, and escalation. Prevent names, case narratives, child information, and other sensitive data from entering the chatbot training or query logs.

Possible Revised Statement or Output

Possible revised output:

Add a data-flow diagram showing User Query → Input Sanitization → Verified Knowledge Base or Classifier → Confidence Check → Safe Response or Human Referral → Privacy-Controlled Log.

8. Security and Privacy

My Evaluation/Comment

Bcrypt, HTTPS, RBAC, throttling, and audit logs do not by themselves prove full compliance with the Data Privacy Act. Full data diffs may create another repository of sensitive information.

My Required Correction/Suggestion

Conduct a privacy-impact assessment covering purpose, lawful basis, data categories, authorized users, notices or consent where applicable, data minimization, retention, deletion, sharing, hosting, third-party processors, data-subject rights, incident response, breach management, backup encryption, and DPO coordination.

Exclude or mask passwords, victim narratives, medical details, addresses, contact numbers, child data, and other sensitive fields from audit logs. Document who may access audit logs and how long they are retained.

Possible Revised Statement or Output

Possible revised statement:

"The system implements selected technical controls, including password hashing, HTTPS, role-based permissions, session controls, and audit logging. Compliance remains subject to a formal privacy-impact assessment, organizational policies, legal review, and objective security testing."

9. Backup and Restoration

My Evaluation/Comment

The "single-click restoration" claim is not supported by objective testing and may itself create an overwrite risk.

My Required Correction/Suggestion

Restrict restoration to specifically authorized administrators and require confirmation, logging, and rollback controls. Report backup encryption, storage location, recovery-point objective, recovery-time objective, restoration test records, record-count/hash verification, failures encountered, and pass-or-fail outcomes.

Possible Revised Statement or Output

Possible revised test statement:

"Three restoration trials were performed in an isolated environment. Each trial verified record counts, file integrity, user access, and transaction consistency. Restoration was considered successful only when all verification criteria passed."

10. Diagrams and Database Design

My Evaluation/Comment

The expected diagrams and database artifacts are present, but terminology and access flows must be checked across all models.

My Required Correction/Suggestion

Conduct a traceability audit connecting every objective, stakeholder requirement, process, DFD flow, data store, database entity, user role, module, test case, and Chapter 4 result. Correct inconsistent names, missing flows, unauthorized access paths, and entities that do not correspond to an implemented requirement.

Chapter 3 Rating: 62%

Possible Revised Statement or Output

Possible revised output:

Add a Requirements Traceability Matrix connecting Objective → Requirement → Diagram Process → Database Entity → Module → Test Case → Chapter 4 Result.

Chapter 4 - Research Methodology, Results and Discussion

1. Research Design

My Evaluation/Comment

The descriptive-developmental design is acceptable, but the study claims practical effectiveness, improved efficiency, monitoring accuracy, risk-assessment accuracy, and improved decision-making without sufficient objective evidence.

My Required Correction/Suggestion

Clarify that perception surveys measure participant assessment and acceptance. Add controlled comparative and technical tests for every objective performance claim. Separate perception-based findings, objective system-performance findings, algorithm-validation findings, and legal/professional validation findings.

Possible Revised Statement or Output

Possible revised statement:

"The study separately evaluated user acceptance, expert perception of software quality, objective task performance, technical controls, and the accuracy of advisory decision-support outputs. Results from one evaluation type were not used as substitutes for another."

2. Data-Gathering Instruments and Likert Scale

My Evaluation/Comment

The methodology states that a five-point scale was used, while the actual TAM and ISO results use four-point scales. The TAM source and adaptation are also insufficiently documented.

My Required Correction/Suggestion

Use the approved four-point scale consistently throughout the manuscript, instruments, appendices, tables, interpretations, and conclusions. Identify the original TAM source, items adapted, revisions, validators, and final instrument.

Use consistent TAM ranges:

Mean Range	Interpretation
3.26-4.00	Strongly Agree
2.51-3.25	Agree
1.76-2.50	Disagree
1.00-1.75	Strongly Disagree

Under these ranges, the overall TAM mean of 3.20 must be interpreted as Agree, not Strongly Agree.

Possible Revised Statement or Output

Possible revised statement:

"A four-point Likert scale was consistently used: 4 - Strongly Agree, 3 - Agree, 2 - Disagree, and 1 - Strongly Disagree. Means of 3.26-4.00 were interpreted as Strongly Agree, while 2.51-3.25 were interpreted as Agree."

3. Population and Sampling

My Evaluation/Comment

The seven actual TAM respondents are not adequately allocated by role, and the 20 pilot respondents are not sufficiently described. The qualifications of the IT raters and validators are also incomplete.

My Required Correction/Suggestion

Present the population, number included, stakeholder category, inclusion criteria, sampling method, and instrument for each group. Explain whether the seven participants constitute the full qualified user population. Describe the 20 pilot respondents and prove that they were similar to the intended users but excluded from actual testing. Present the education, role, years of experience, and relevant expertise of every validator and IT evaluator.

Possible Revised Statement or Output

Possible revised statement:

"The seven actual users consisted of ___ VAW Desk Officers, ___ BCPC representatives, ___ GAD personnel, ___ administrative staff, and ___ organization heads. They were selected through ___ because ___."

4. Content Validation

My Evaluation/Comment

Chapter 5 reports an I-CVI and S-CVI/Average of 1.00, but Chapter 4 does not present the complete validation results.

My Required Correction/Suggestion

Move the complete content-validation findings to Chapter 4. Present the validation criteria, individual ratings, I-CVI per item, S-CVI computation, qualitative comments, revisions made, and final decision. Chapter 5 should only summarize these already presented results.

Possible Revised Statement or Output

Possible revised output:

Present Item, Validator Ratings, I-CVI, Qualitative Comment, Revision Made, and Final Decision. Report S-CVI/Average only after the complete item-level table.

5. TAM Pilot Testing

My Evaluation/Comment

The Cronbach's alpha values provide preliminary internal-consistency evidence, but the eligibility of the 20 pilot respondents is not established. Reliability does not prove content validity, construct validity, or system accuracy.

My Required Correction/Suggestion

Identify the pilot respondents, inclusion criteria, recruitment source, administration procedure, and exclusion from actual testing. Interpret Cronbach's alpha only as internal consistency. Do not use it as evidence that the system or questionnaire content is automatically accurate.

Possible Revised Statement or Output

Possible revised statement:

"The Cronbach's alpha values indicate the internal consistency of the adapted TAM items among the pilot respondents. They do not demonstrate system accuracy, technical quality, or construct validity by themselves."

6. ISO/IEC 25010 Pilot Testing

My Evaluation/Comment

I do not accept the statement that a Fleiss' kappa of 0.322 provides a "solid basis" for proceeding without revision. It indicates only fair agreement, and Fleiss' kappa alone does not establish complete instrument reliability or validity.

My Required Correction/Suggestion

Identify the items that produced disagreement, obtain the raters' comments, revise ambiguous items, and document the changes before actual administration. Use content validation for item relevance and Fleiss' kappa only for rater agreement. Report these as distinct forms of evidence.

Possible Revised Statement or Output

Possible revised statement:

"The fair agreement result prompted a review of items ___, ___, and ___. The wording was clarified based on the raters' comments before the final instrument was administered."

7. TAM Actual Results

My Evaluation/Comment

The overall mean of 3.20 is inconsistently interpreted as Strongly Agree, while a lower range is used to interpret 3.08 as Agree. Behavioral Intention is also discussed as though it proves future actual use.

My Required Correction/Suggestion

Recalculate and reinterpret every TAM table using one approved range. Revise 3.20 to Agree if the stated ranges are adopted. State that Behavioral Intention reflects reported intention at the time of the evaluation and does not establish sustained actual use.

Possible Revised Statement or Output

Possible revised statement:

"The overall TAM mean was 3.20, interpreted as Agree. This indicates positive acceptance among the seven respondents during the evaluation period but does not establish sustained actual use."

8. ISO/IEC 25010 Actual Results

My Evaluation/Comment

The overall means are high, but Fleiss' kappa of 0.0683 indicates only slight agreement among the four experts. Perception ratings do not objectively prove response time, fault tolerance, recovery, security, compatibility, maintainability, or portability.

My Required Correction/Suggestion

Investigate and report the items with the greatest disagreement. Discuss the low agreement as a limitation. Use the wording "rated Highly Acceptable by the participating IT experts" and do not claim ISO compliance. Supplement the ratings with objective technical test tables.

Suggested discussion:

"Although the overall ISO/IEC 25010 mean was high, the Fleiss' kappa result indicated only slight agreement. Therefore, the mean is interpreted as a perception-based summary of the participating experts' ratings and not as conclusive proof of objective software quality or ISO compliance."

Possible Revised Statement or Output

Possible revised statement:

"The system was rated Highly Acceptable by the four participating IT experts. However, the Fleiss' kappa value indicated slight agreement; therefore, the mean is treated as a perception-based summary rather than proof of ISO compliance."

9. Missing Objective Tests

My Evaluation/Comment

Chapter 4 lacks adequate objective testing for the manual comparison, risk engine, nutrition calculation, legal workflow, chatbot, access control, security, performance, compatibility, backup, recovery, audit logging, masking, and session controls.

My Required Correction/Suggestion

Add dedicated result tables containing the test condition, records or trials, expected result, actual result, numerical measurement, evaluator, evidence, and pass-or-fail outcome. At minimum, test record retrieval, report generation, record completeness, risk classification, nutrition calculation, BPO/referral workflow, chatbot performance if retained, role restrictions, unauthorized access, response time, concurrent users, browsers/devices, backup restoration, audit-log integrity, masking, session expiration, throttling, and recovery.

Possible Revised Statement or Output

Possible revised output:

Use a test table with Test ID, Quality Area, Scenario, Records or Trials, Expected Result, Actual Result, Measurement, Evidence, and Pass or Fail.

10. Objectives 1 and 4

My Evaluation/Comment

Objectives 1 and 4 are not adequately answered because no complete manual-versus-system comparison establishes the claimed improvements.

My Required Correction/Suggestion

Conduct equivalent task trials using the same records and outputs for both manual and digital processes. Report participants, device, browser, network, timing tool, trial count, mean, median, standard deviation, minimum, maximum, difference, percentage improvement, and pass-or-fail criterion. Do not claim improvement until the comparison is completed.

Chapter 4 Rating: 45%

Possible Revised Statement or Output

Possible revised statement:

"The same records and equivalent outputs were used for the manual and digital trials. The comparison reports the mean, median, standard deviation, range, paired difference, percentage improvement, and test conditions."

Chapter 5 - Summary, Conclusions and Recommendations

1. Summary

My Evaluation/Comment

Chapter 5 includes content-validation results that were not fully presented in Chapter 4 and summarizes claims unsupported by complete objective evidence.

My Required Correction/Suggestion

Rewrite the summary only after revising Chapter 4. Follow the sequence of the final objectives and report only the evidence already presented in Chapter 4. Separate pre-assessment, development output, objective tests, algorithm validation, expert perceptions, user acceptance, and limitations.

Possible Revised Statement or Output

Possible revised opening:

"This chapter summarizes the findings in the same sequence as the revised objectives. It distinguishes pre-assessment findings, system-development outputs, objective test results, advisory-model validation, expert ratings, user acceptance, and study limitations."

2. Conclusions

My Evaluation/Comment

Several conclusions exceed the available evidence. Positive respondent ratings do not prove objective efficiency, accurate risk classification, effective data protection, or ISO compliance.

My Required Correction/Suggestion

Use evidence-bounded conclusions. Replace "met ISO requirements" with: "The system was rated Highly Acceptable by the four participating IT evaluators based on the perception-based ISO/IEC 25010 questionnaire."

Replace "the system improved administrative efficiency" with: "The respondents perceived that the system could support administrative activities; the extent of improvement must be determined through objective manual-versus-system testing."

Replace any accuracy claim for the risk model with: "The system includes a preliminary advisory risk indicator whose accuracy and operational safety require independent validation by qualified VAWC professionals."

Replace "fully compliant with the Data Privacy Act" with: "The system incorporates selected privacy and security controls; formal legal review, privacy-impact assessment, organizational policies, and objective security testing remain necessary."

Possible Revised Statement or Output

Possible revised conclusion:

"The system received positive perception-based evaluations from the participating users and IT experts. These ratings do not independently establish legal compliance, technical security, risk-classification accuracy, or objective process improvement."

3. Recommendations

My Evaluation/Comment

The recommendations prioritize additional features even though the existing high-risk functions remain insufficiently validated.

My Required Correction/Suggestion

Prioritize validation and risk reduction before feature expansion. Complete the risk-model validation, nutrition verification, legal-workflow review, privacy-impact assessment, security testing, backup/recovery testing, and controlled pilot implementation before recommending mobile applications, GIS, SMS, cross-agency integration, or broader deployment.

Recommend continued limited pilot use only with de-identified/simulated data or formally authorized records, controlled access, professional oversight, and documented incident-response procedures.

Chapter 5 Rating: 54%

Possible Revised Statement or Output

Possible revised recommendation:

"Before full deployment, the researchers recommend a controlled and formally authorized pilot implementation, completion of the privacy-impact assessment, expert validation of the advisory risk indicator, verification of nutrition computations, security and recovery testing, and revision of the system based on

documented pilot findings."

Required Priority Sequence

I require the group to complete the revisions in this order:

1. Narrow and authorize the final scope.
2. Correct the title if the risk model remains unvalidated.
3. Complete and present the pre-assessment.
4. Correct the research questions and objectives.
5. Validate or remove the VAWC-RAVE mechanism.
6. Correct the BPO roles and obtain legal workflow validation.
7. Validate the nutrition computation or remove automatic classification/enrollment.
8. Remove or fully validate the AI legal chatbot.
9. Complete the privacy-impact assessment and revise audit logging.
10. Correct the ISO edition, Likert scale, sampling, and instrument-validation discussion.
11. Conduct the objective manual-versus-system and technical tests.
12. Verify and correct every reference.
13. Rewrite Chapter 4 based on the completed evidence.
14. Rewrite Chapter 5 so every conclusion is directly supported by Chapter 4.
15. Conduct a controlled and formally authorized pilot before recommending operational adoption.

Suggested Revised Title

If the risk model remains unvalidated:

A Web-Based Women and Family Protection and Support Management System for Barangay 183, Villamor Airbase, Pasay City

If it is independently validated:

A Web-Based Women and Family Protection and Support Management System with an Expert-Validated Vulnerability Risk-Assessment Tool for Barangay 183, Villamor Airbase, Pasay City

Overall Adviser's Comment

I find the study socially relevant and potentially useful to Barangay 183. However, the system processes highly sensitive VAWC, child, health, and family information and therefore requires a much higher level of legal, ethical, security, and technical validation. The current results mainly establish positive perceptions from a small group of users and IT experts. They do not yet establish the accuracy of the vulnerability risk assessment, correctness of the nutrition computation, safety of the chatbot, effectiveness of the legal

workflow, objective improvement over the manual process, or full privacy and security compliance. I require you to complete the matched corrections stated under every chapter and topic, present the missing objective evidence, verify all references, and revise Chapter 5 based only on findings properly established in Chapter 4. Until these requirements are satisfied, I do not recommend the system for full operational adoption.
